Slot: A

Course Name: PYTHON PROGRAMMING

Course Faculty: Dr. J. Prabakaran

Project Title: Automated Social Media Sentiment Normalization Tool with CLI, Textual Histogram & SQL Integration

Module Photographs: (3 photographs –Module Photo, Individual student contribution module work in the project and presentation image)

Project Description: Module 3- Implements the SQL Integration and Result Management

This module implements the SQL Integration and Result Management component of the proposed sentiment analysis system. It establishes a structured SQL database for storing and managing sentiment analysis results, including processed text, sentiment labels and sentiment scores. Structured tables are designed to maintain analysed records systematically and reliably. SQL queries are implemented to insert, retrieve, update and manage sentiment records efficiently. The module enables rapid retrieval of stored results for analysis, reporting and future reference. It provides persistent and organized storage, ensuring that generated sentiment results are maintained in a consistent and accessible form. The database is integrated with the complete sentiment analysis workflow, linking processed input and classified results with systematic data storage. The module also supports generation of summarized reports from stored sentiment data, improving the clarity and usability of analysis results. By combining Python-based analysis with SQL database management, the module strengthens the overall system's reliability, organization and practical usability. **Overall, Module 3 delivers an efficient and dependable mechanism for structured storage, retrieval, management and reporting of sentiment analysis results.**
